Definition: Pfad (path) Die Sequenz $p = \{v_0, ..., v_n\}$ heißt Pfad, wenn gilt: Für jedes i = 0, ..., n-1 ist $\overline{v_i v_{i+1}}$ eine Kante Keine Kante kommt doppelt vor Ein Pfad $p = \{v_0, ..., v_n\}$ heißt geschlossen (closed), wenn $v_n = v_0$

Abbiegevorschrift

- □ Durch das Invertieren der Pixel:
 - Immer rechts bekommt andere Bedeutung
- Mögliche Modifikation:
 - Immer schwarz
 - Definiere Richtung basierend auf der Farbe im Originalbild so, dass schwarze Pixel zusammenhängen

Zusammenfassung

- Verschiedene Algorithmen zum Finden von Konturen
 - Grobe Idee meistens klar
 - Aufwand steckt im Detail
- Definition des Zusammenhangs ist wichtig
 - 4er oder 8er Nachbarschaft
- Verschiedene Definition von Kanten
 - Auf den Pixeln laufend
 - Zwischen den Pixeln laufend
